

ABSTRACT

A music reproduction apparatus (200) receives, from a tuning server (400), radio station information making up genres of music distributed from respective radio servers (300) and URLs of the respective radio servers (300). When a genre and a keyword
5 representing characteristics of music are input to the music reproduction apparatus (200), the music reproduction apparatus (200) requests the radio server (300) distributing the music of the input genre to transmit the music information on the basis of the radio station information. The requested radio server (300) transmits one or more keywords to the
music reproduction apparatus (200) as music information indicative of the characteristic
10 of the music being broadcasted now. When the input keyword and the keyword included in the music information match with each other, the music reproduction apparatus (200) receives broadcast of the radio server (300) that has transmitted the music information.
